Detailed Project Report

SMA RICE MILL

Prepared By
BMTAX INDIA (OPC) PRIVATE LIMITED

CONTENTS

1. EXECUTIVE SUMMARY

- 1.1 Project Snapshot - Introduction and Overview
- 1.2 Entity Details
- 1.3 Profile of Promoters, Business Owners
- 1.4 Employment Details
- 1.5 Cost of Project
- 1.6 Means of Finance
- 1.7 Security Details
- 1.8 Existing Obligations
- 1.9 Subsidy

2. PROJECT VIABILITY & MARKET STUDIES

- 2.1 Feasibility Studies
- 2.2 Industry Analysis
- 2.3 Market Potential
- 2.4 Process
- 2.5 Current Scenario
- 2.6 Challenges and Solutions
- 2.7 SWOT Analysis

1. EXECUTIVE SUMMARY:

1.1 Project Snapshot - Introduction and Overview

India is one of the biggest producers of rice in the world next to China. It accounts for about 31 percent of the area and 41 percent of the total production of food grains in the country. It is a staple food of the people of the southern and Northern Western States coastal areas and hilly areas.

The crop is grown in almost all the states of the country but its cultivation is mostly concentrated in the states of Andhra Pradesh, West Bengal, Tamil Nadu, Uttar Pradesh, Bihar, Orissa, Madhya Pradesh, Punjab, Karnataka and Assam which account for more than 66 per cent of the total paddy produced in the country.

Paddy milling industry is one of the largest agro based industries in the country. There are reported to be 91,154 rice-milling units spread through out the country. These units process 80 percent of the paddy produced in the country. The other 20 percent is processed by traditional methods or consumed in various form. With the introduction of high yielding varieties that improved economic practices, the production of paddy is expected to be increased in the years to come. There are still a larger number of units in the country using the outdated technology like old hullers. The Central Food Technological Research Institute Mysore has developed a technology for processing of rice to secure an improved out turn rations from paddy to rice a superior quality of milled products reduction of wastage, with better economic returns to producers and processors.

Rice is the staple food for almost 65% of the population in India. Paddy in its raw form cannot be consumed by human beings. It needs to be suitably processed for obtaining rice. Rice milling is the process which helps in removal of hulls and barns from paddy grains to produce polished rice. Rice forms the basic primary processed product obtained from paddy and this is further processed for obtaining various secondary and tertiary products.

Rice is one of the most important food crops of India in term of both area, production and consumer preference. India is the second largest producer and consumer of rice in the world. Rice production in India crossed the mark of 150 million MT in 2013-14 accounting for 22.81% of global production.

SMA Rice Mill is a Proprietorship Firm. Business Owners have incorporated / formed an entity name **SMA Rice Mill** in **September, 2025**. and want to start **SMA Rice Mill** activities. business will be start in **Chakrabasti, No.5 Baruajhar, Darrang (Assam) , 784116**, as a **Manufacturing (Rice Mill)** and associated with a well-known brand in this field.

Funding for business

As the owners are having a good business connection in the locality and sales targeted area, it will be easier to gain good revenue from the business. The goodwill of the organization will be created at a greater extent. Once the business will start achieving higher sales, large scale economies will help the business to earn more profits. Such higher revenue will help the business in achieving higher Net Profit, Gross profit ratios and overall positive incremental revenue.

1.2 Entity Details

Entity & Owner Details:	
Name of the Entity :	SMA RICE MILL
Name of the Partner(s):	Musharaf Hussain, Suleman Ali & Ashik Akram Ansari
Pan Number	Applied for.
Year of Establishment	Sept, 2025
Registered under	Partnership Firm
Business Description	RICE MILL
Address of the Entity	Chakrabasi, No-5 Baruajhar,Darrang,ASSAM,784115

1.3 Profile of Promoters, Business Owners

The driving force behind every business is increased sales and high profits. Businessmen should be confident about the product they are selling as well as their own ability to successfully gain the trust, arouse an interest and eventually convince them to try a new product. The Business owners are having all such qualities inherently and were able to develop the same during the business course of their other respective businesses. Convincing a prospective customer to buy a product is not an easy task. Selling is an art and requires patience; applicant is skillful in such task & it can be considered as a plus point for an entity.

1.4 Employment Details

One should insist to increase the employment levels of the country. In the light of this, entrepreneurs and business owners help the economy by generating employment in urban and rural areas.

In coming years and decades, India is expected to witness significant demographic growth and expansion in the working age population. To absorb such labor force in the future, all the sectors viz. manufacturing, service, trading and agriculture would need to play an important role. Currently manufacturing sector accounts for approximately 11% to 13% of the total employment in the country, which is well below its true potential. Small and medium enterprises (SMEs) and micro small and medium enterprises (MSMEs) account for 90%+ of the total industrial activity in India.

Estimates suggests, the SME and MSME sector offers maximum opportunities for self-employment as well as jobs, after the agricultural sector. Also, the labor-capital ratio tends to be higher for SMEs and MSMEs. **SMA RICE MILL** will help the economy by way of employment generation, as it is going to generate employment to **15** people.

Total number of employees : **15**

Incremental employees due to expansion of the business (if any) : 0

1.5 Cost of Project

Estimating the cost of a project varies based on the industry, the type and scope of the project undertaken and the time frame for completing the project. While the variables of any given project may change according to circumstances, there are 3 main elements of project costing found in most all project cost estimations.

Pre-Planning - Costs related to pre-project planning and preparation vary widely from industry to industry. Typical pre-planning costs include selecting potential project managers and employees, conducting market and project research.

Material Costs - All materials necessary for a project are included in material costs. Materials are anything the project manager purchases to aid in or conduct the project.

Operating Costs - The operating costs of a project include the fees associated with purchasing project supplies, paying rent and associated costs on a facility or location for the project to take place, the cost of permitting, inspections and daily operations.

Such costs can further be divided into 2 types viz. capital **expenditure and revenue expenditure**. For manufacturing industry, setting up the plant, installation of machinery, building/factory set up costs are the major costs.

Funds are required incidentally in a way of term loan of **Rs. 0** lakhs and for forming a business cycle of receivables & payables, Working Capital of **Rs. 50.00** lakhs is also required for the day to day business transactions, in a constant liquid form & Rs. 144.79.00 Lakhs from Own Source.

Detailed particulars about the cost have been provided hereunder:

Purchase Asset Costs:

Sr. No.	Assets	Before Oct. (Rs. in lakhs)	After Oct. (Rs. in lakhs)
1	Land	Nil	0.00
2	Building & Construction	30.00	0.00
3	Plant and Machinery	59.19	0.00
4	Furniture & Fixtures	2.10	0.00
5	Computers & Printers	00.50	0.00
6	Electric Equipment+Security	18.00	0.00
7	Vehicles	00.00	0.00
8	Software(s)	00.00	0.00
9	Installation Charges (if any)	04.00	0.00
10	Security Deposits	06.00	0.00
	Sub Total	119.79	0.00
	Total	119.79	

Working Capital :

Sr. No.	Working Capital	(Rs. in lakhs)
1	Working Capital+Others	Rs.75.00

TOTAL COSTS OF PROJECT

Sr. No.	Particulars	(Rs. in lakhs)
1	Asset Purchase Costs	119.79
2	Working Capital	075.00
	Total	194.79

1.6 Means of Finance

SMA Rice Mill needs total funds amounting to Rs. 224.79 lakhs. Out of total funds of Rs. 224.79 lakhs, Rs. 94.78 lakhs will be brought in by the promoters and/or business owners and for the balance amount they need a funding facility viz. Rs. 60.00 (Term Loan). and Rs90.00 (Cash Credit).

SOURCES OF FINANCE	(Rs. in lakhs)
Term Loan	00.0
Cash Credit	50.00
Own Contribution (Asset Addition)	59.79
Own Contribution (Working Capital)	122.79
Total	244.79

1.7 Security Details:

Sr. No.	Type of Security (e.g Flat, Plot, Industrial Land, etc.)	Value of the security offered (in rupees)
1	Machinery	Rs. 59.19

1.8 Existing Obligations

The business owners are not having any heavy existing obligations, although, we have provided the documents such as Sanction letters and Bank statements of existing loans (if any), in order to assess the existing banking commitments.

1.9 List of Machinery & Depreciation Schedule :

Sr. No.	Name of Machinery	Cost of Machinery (Rs.)
1	Paddy Pre Cleaner	250000
2	MG-De stoner with Vibro Motors	275000
3	M.G. Pneumatic Rubber Roll Sheller DMR-10" With Separate Husk Aspirator and Sieve	900000
4	MG-Paddy Separator Full butterfly	475000
5	MG-Rice Whitner	960000
6	ASPIRATION SYSTEM	185000
7	S.Bend Complete With 3HP Blower ,Pipeline	95000

	& Cyclone	
8	MG-Rice Plan Sifter	250000
9	Single Elevator	1246000
10	Auto weighing and Fortified Rice Blender Complete With Panel Box	380000
	Sub Total	5016000
	GST On Machinery @18%	902880
	Grand Total	5918880

1.10 Working Capital : “The unit has an installed milling capacity of 6 TPH. For working capital assessment, effective operation has been considered at 8 hours per day and 75% capacity utilization, resulting in estimated throughput of 36 MT per day. Considering raw material procurement, labour wages, electricity charges, packing materials, repairs & maintenance, handling and administrative overheads, the average daily operating fund requirement is assessed at approximately ₹10.00 lakh. Accordingly, for an operating cycle of 7 days, the total working capital requirement is estimated at ₹70.00 lakh.”

1) Production Capacity Basis

Given:

- **Milling capacity = 6 ton per hour**
- Assume bank calculation on:
 - **8 operating hours/day**
 - **75% capacity utilization** (practical basis)

So:

- **Daily processing = $6 \times 8 \times 75\% = 36$ tons/day**
- **7-day cycle quantity = $36 \times 7 = 252$ tons**

2) Working Capital Requirement

So daily working capital need:

- **$₹70,00,000 \div 7 = ₹10,00,000$ per day**

Cost per ton basis:

- **$₹70,00,000 \div 252 \text{ tons} = ₹27,777.78$ per ton (all-in operating cost basis)**

3) Suggested Cost Build-up (Including Labour + Electricity)

This is the **basis** you can show in DPR / bank note.

Illustrative Daily Cost (36 tons/day)

Particulars	Daily Amount (₹)	Remarks
Paddy / Raw material	9,20,000	Main component
Labour / wages	25,000	Operators, helpers, loading staff
Electricity	20,000	Milling + polishing + grading etc.
Packing materials	10,000	Bags, stitching, consumables
Repairs & maintenance	8,000	Running maintenance provision
Loading / unloading / transport (internal)	7,000	Handling

Particulars	Daily Amount (₹)	Remarks
Admin / factory overhead	10,000	Misc. running expenses
Total per day	10,00,000	
For 7 days	70,00,000	Working Capital Required

✓ This directly supports your ₹70 lakh WC requirement.

4) How to Explain Labour & Electricity (Important for Bank)

Labour Cost Basis (example)

You can write:

- Labour cost considered based on **machine operators + helpers + loading/unloading staff + supervisor**
- Estimated on **daily wage / monthly salary basis**, converted into **daily operating cost**
- Included in working capital as part of **7-day operating cycle cash requirement**

Electricity Cost Basis (example)

Electricity can be justified by either method:

Method A (Preferred if meter/load details available)

- **Units consumed/day = Connected Load (kW) × Running Hours × Load Factor**
- **Electricity cost/day = Units × Tariff per unit + fixed charges (apportioned)**

Method B (Practical DPR basis)

- **Power cost per ton × daily tons**
- Example: if power cost ≈ **₹550 per ton**, then:
 - 36 tons × ₹550 = **₹19,800/day** (rounded to ₹20,000/day)

5) Bank Finance (CC Limit) – Margin Angle

Banks usually do not fund 100% of working capital.

If **₹70 lakh is total WC requirement**, then (illustrative):

- **Promoter margin (28.57%) = ₹ 20.00 lakh**
- **Bank finance (71.43%) = ₹ 50.00 lakh**

Some banks may assess on **stock + receivables - creditors** (MPBF / drawing power basis), so final sanctioned CC can vary.

Note : Projection for Working Capital Attached in Annexure-I.

2. Area of Rice Mill :

Rice mill capacity of 6-8 TPH **15,000–20,000 sq. ft.** of constructed area, including sections for raw paddy storage, processing machinery, finished goods warehouse, drying yard, and office facilities. Proper layout planning ensures smooth workflow, safety compliance, and efficient material handling across all stages of milling operations.

MACHINERY LAY-OUT PLAN
SCALE = 1 : 100

SITE PLAN
SCALE = 1 : 200

3. Working Capital Assessment – Rice Milling Operations

- 3.1 Operating Profile:** The mill operates at a capacity of 8 tons per hour for 8 hours per day, resulting in an estimated daily throughput of approximately 64 tons. Based on the provided cash operating cost of ₹150,000 per hour, the daily operating outflow works out to ₹1,200,000.
- 3.2 Working Capital Requirement:** The collection/realisation cycle is 10 days. Accordingly, the working capital required to sustain operations over the cycle is computed as Daily Operating Cost × Cycle Days. Thus, the total requirement is ₹1,200,000 × 10 = ₹12,000,000. This represents the cash locked in raw material/processing costs until sales proceeds are realised.
- 3.3 Per-Ton Economics:** At a daily throughput of 64 tons and a daily cost of ₹1,200,000, the cost per ton works out to approximately ₹18,750 per ton. This aids in pricing decisions and margin assessment for the lending appraisal.
- 3.4 Indicative Bank Finance Structure:** For presentation to the bank, assuming a margin of 25% on working capital, the eligible bank finance would be ₹9,000,000, with the balance ₹3,000,000 brought in as promoter's margin. This percentage may be aligned to the sanction policy of the lending institution (commonly 20–30%).
- 3.5 Assumptions & Notes:** 1) The 'cost per hour' is assumed to include cash costs necessary to keep the plant running (e.g., paddy procurement, power, labour, and other variable overheads). 2) If supplier

credit is available or if receivables/inventory holding differs from the stated cycle, the operating cycle should be adjusted to reflect the net cash conversion period. 3) Where applicable, separate assessments for inventory holding and receivable days may be added to refine the limit calculation. 4) The above is a cash-cost working estimate intended for bank appraisal and can be further supported with historical statements and sales realisation trends.

3.6 Processing Flow :

- **Pre-Cleaning**

- Raw paddy contains dust, soil, stones, straw, and other impurities.
- It passes through vibratory cleaners and aspirators to remove foreign matter.

- **De-Stoning**

- Paddy often carries small stones and heavy impurities.
- A destoner machine separates them using gravity and airflow.

- **Parboiling (Optional)**

- Paddy is soaked, steamed, and dried before milling.
- This strengthens the grain, reduces breakage, and improves nutrition.

- **Husking (De-Husking)**

- The husk (outer shell) of paddy is removed by rubber-roll shellers.
- This produces **brown rice** (rice with bran layers still intact).

- **Husk Aspiration**

- Air suction removes the husk from the mixture of brown rice and unhusked paddy.

- **Paddy Separation**

- Any remaining paddy is separated from brown rice using a paddy separator.
- Unhusked paddy is recycled back for husking.

- **Whitening (De-Branning)**

- Brown rice is passed through a whitener to remove bran layers.
- Produces **white rice**, but also generates rice bran (used for oil extraction).

- **Polishing (Silky/Mist Polishing)**

- Polishes the rice kernel to improve appearance, luster, and smoothness.
- Removes remaining bran particles.

- **Grading & Length Separation**

- Separates broken rice from full grains using graders and sifters.
- Head rice, medium broken, and small broken are classified.

- **Color Sorting (Optional, Premium Quality)**

- A color sorter removes discolored, chalky, or defective grains.
- Ensures high-quality rice for export and premium markets.

- **Weighing & Bagging**

- Final rice is weighed, packed in 25/50 kg bags, or bulk packaged.
- Bran and husk are stored separately for sale as by-products.

1.1 Subsidy

Government subsidies are monetary grants provided by the government to private institutions or other public entities, in order to stimulate economic activity or promote activities that are in the public good. Subsidies encourage companies to undertake economic activities and business ventures that the government sees as in the public's best interest. Like indirect taxes, they can alter relative prices and budget constraints and thereby affect decisions concerning production, consumption and allocation of resources.

There are 2 main types of subsidies: Direct subsidies and Indirect subsidies. Direct subsidies are those that involve an actual payment of funds toward a particular individual, group or industry. Indirect subsidies are those that do not hold a predetermined monetary value or involve actual cash outlays. They can include activities such as price reductions for required goods or services that can be government-supported. Other than that, there are various types of Subsidies viz. Cash subsidies, tax concessions, Government purchases policies, etc.

SMA Rice Mill is a business in manufacturing sector and is eligible for specified subsidies by the Government.

2. PROJECT VIABILITY & MARKET STUDIES

2.1 Feasibility Studies

A feasibility analysis evaluates the project's potential for success; therefore, perceived objectivity is an essential factor in the credibility of the study for potential investors and lending institutions. One of the prerequisites for a successful business or unit is to have the technically feasible business model. A technical feasibility evaluates the details of how you propose to deliver a product or service to customers. Think materials, labour, transportation, where your business will be located, and the technology that will be necessary to bring all this together.

There are five types of feasibility studies—separate areas that a feasibility study examines. Some major points out of them as explained below.

Technical Feasibility: This assessment focuses on the technical resources available to the organization. It helps organizations determine whether the technical resources meet capacity and whether the technical team is capable of converting the ideas into working systems. Technical feasibility also involves the evaluation of the hardware, software, and other technical requirements of the proposed system.

Economic Feasibility: This assessment typically involves a cost/ benefits analysis of the project, helping organizations determine the viability, cost, and benefits associated with a project before financial resources are allocated. It also serves as an independent project assessment and enhances project credibility—helping decision-makers determine the positive economic benefits to the organization that the proposed project will provide.

Operational Feasibility: This assessment involves undertaking a study to analyses and determines whether—and how well—the organization's needs can be met by completing the project. Operational feasibility studies also examine how a project plan satisfies the requirements identified in the requirements analysis phase of system development.

Carrying on aforementioned feasibility studies is an essential part of pre-planning activities. As manufacturing is the process of converting raw materials and/or parts into finished goods that can be

sold in wholesale or retail markets or exported for sale in other countries. It covers a wide range of industries, from food and beverages to pharmaceuticals, iron and steel to textiles, as well as lumber, tobacco, automobiles, aerospace, and petrochemicals.

After considering most of the aforementioned factors and points, a detailed feasibility study viz. Technical, economical and operational – have been carried out by the promoters / owners of the entity, and based on their personal due diligence and in-depth knowledge of the market, the project /company and its business operations are feasible in all the possible ways.

A detailed financial feasibility study has also been carried out based on the current demand – supply analysis and data & assumption-based projections ; which has been separately presented in the FINANCIAL FEASIBILITY section in (3) Financial Data & Ratios. 'Sensitivity analysis' and 'assessed bank finance' studies will help in ascertaining the financial viability of the project.

A rice mill is a food-processing facility where paddy is processed to rice to be sold in the market. The entire product is procured from paddy fields, milled and processed hygienically in modern machinery and dust-free environment and cleaned through sorting machines. The skilled & unskilled labour are required for the service of rice mills and Due to abundant availability of labour & land productivity of business rises. Thereby providing rice mill services in the market with a continuous service delivery. So business grow at very fast in the globe.

The working hours of service is 24 hours, so they grab more customer & earning more profit. They choose from numerous types of modern rice mill plant layouts. Rice milling involves the process of removal of husk, bran and then polishing. Husk is sold in the market as cattle feed and fuel. Bran is used for extracting oil. Broken rice is sold for a cheap price. Rice mill Service business, revenue-wise, has very good income potential. So, it would be feasible to setup a unit for the rice mill.

Below are some key benefits of conducting a feasibility study:

- Improves project teams' focus
- Identifies new opportunities
- Provides valuable information for a "go/no-go" decision
- Narrows the business alternatives
- Identifies a valid reason to undertake the project
- Enhances the success rate by evaluating multiple parameters
- Aids decision-making on the project
- Identifies reasons not to proceed

Apart from the approaches to feasibility study listed above, some projects also require other constraints to be analysed -

- Internal Project Constraints: Technical, Technology, Budget, Resource, etc.
- Internal Corporate Constraints: Financial, Marketing, Export, etc.
- External Constraints: Logistics, Environment, Laws, and Regulations, etc.

After considering most of the aforementioned factors and points, a detailed feasibility study viz. Technical, economical and operational - have been carried out by the promoters / owners of the entity, and based on their personal due diligence and in-depth knowledge of the market, the project /company and its business operations are feasible in all the possible ways.

A detailed financial feasibility study has also been carried out based on the current demand - supply analysis and data & assumption-based projections ; which has been separately presented in the FINANCIAL FEASIBILITY section in (3) Financial Data & Ratios. 'Sensitivity analysis' and 'assessed bank finance' studies will help in ascertaining the financial viability of the project.

2.2 Industry Analysis

It is important to understand the operating environment of the business in this way can help the business holder to formulate an effective tactic, position the company for success, and make the most efficient use of the limited resources of the business.

Role of Manufacturing is changing as striving target has been set by the Government of India for increasing the contribution of manufacturing output to 25 percent of Gross Domestic Product (GDP) by 2025 from the current 16 percent.

Manufacturing has arisen as one of the high growth sectors in India. Prime Minister of India, Mr. Narendra Modi, propelled the 'Make in India' program to place India on the world map as a manufacturing center and give universal recognition to the Indian economy. Government purposes to create 100 million new employments in the sector by 2022.

The process of evolving as a global manufacturing hub has already started in India with global manufacturing majors setting up shop in India along with their domestic counterparts. A strong pipeline of existing projects from both global and domestic firms highlights the growing importance of the country as a market as well as a production hub.

Manufacturing industries are the chief wealth generating sectors of any economy. Manufacturing industries are important for an economy as they employ a huge share of the labor force and produce materials required by other sectors. Manufacturing sector in India has the potential to raise much of the Indian population above poverty by shifting majority of the workforce out of low-wage agriculture. In any country, manufacturing sector is the backbone of any economy as it improves growth, productivity, employment and strengthens agriculture and service sectors. Astrological growth in worldwide distribution systems and IT, coupled with opening of trade barriers, has led to increase growth of global manufacturing network. This has been designed to take advantage of low- waged with efficient work force of India.

In order to perform an industry analysis, one needs to assess the impact of Porter's five forces. "The collective strength of these forces determines the ultimate profit potential in the industry, where profit potential is measured in terms of long-term return on invested capital," Porter stated. Porter's five forces for Industry analysis are:

- i. Ease of Entry
- ii. Power of Suppliers
- iii. Power of Buyers
- iv. Availability of Substitutes
- v. Competitors

Manufacturing industry in India is a booming sector. Investments in the Indian manufacturing market are at an all-time high. Gross Fixed Capital Formation is currently at US \$614.85 billion. Government initiatives 'Make in India' or 'Vocal for Local' are sector-specific & are aimed towards making India a global manufacturing center. Therefore, more global giants are turning towards Counselors for Manufacturing Industry in India for Manufacturing Industry Business Set up in India.

Today, globalization has carried manufacturing forward. Experts predict that the next revolution in

Manufacturing will be prompted by the increasing demand for customized products and smart devices, and be transformed by the development of technology.

The strong demand of manufacturing products has pushed the Indian manufacturing industry to a new level. It is expanding to meet the growing demands of the people. According to some economists, manufacturing industry is a wealth-producing sector of an economy.

The manufacturing industry in India contributes about 15% of the country's GDP. Under the National Manufacturing Policy 2015, determined programs are under way to take this figure to 25 percent and the total output from this sector to \$1 trillion by upcoming 2 years.

India's manufactured exports are worth over \$180 billion, or 45 percent of the country's total exports, with the biggest exports being engineering goods, chemicals and related products, and leather goods.

On the basis various factors related to industry analysis, a detailed scrutiny was carried out by the promoters / business owners and to conclude, based on the SWOT and Porter's five forces business model, they found the industry very demanding and scope for the business is unrestricted.

The high production of rice in this region and increasing demand for good quality rice are some key drivers for the growth of the rice milling market in India.

Although traditional methods are still prevalent in India, including for rice harvesting, rice millers are increasingly investing in modern, high-quality rice milling equipment to increase yield and quality of the final product. In addition to favorable policies, the government also offers various facilities and subsidies to promote modern agricultural activities. Foreign investors have recognized India's position as a global rice producer and have accordingly set up rice milling machinery manufacturing units to meet the demand and leverage cheap labor costs available in the region.

Improper storage and lack of appropriate warehouse facilities along with unpredictable crop failure are some of the challenges faced by this market. However, ongoing development in agriculture is expected to offer solutions and opportunities for expansion of the market in the coming years

The Indian rice milling market has been segmented into equipment, capacity, and region. By equipment, the market has been segmented into rice whitening machinery, pre-cleaner machinery, paddy separator machinery, length grader machinery, and others.

East India accounts for the largest share of the rice milling market. This is primarily due to the fact that rice has traditionally been grown in this region which naturally has high rainfall and the area is conducive to the growth of rice. This has prompted a high number of planned investments in rice milling, this facilitating growth for the market. The East India regional segment is poised to grow at a consistent CAGR of 3.97% during the forecast period.

Prominent market players who are operating the Indian rice milling market include Parker Engineers, Satake Corporation, Buhler Group, Mill Master Machinery Pvt. Ltd., G.G. Dandekar Machine Works Ltd., Perfect Equipment's, Savco Sales Pvt Ltd., Fowler Westrup, and G.S International.

India and China have just signed an agreement to amend a pre-existing protocol on phytosanitary

requirements. The signing of this agreement will allow India to export non-basmati rice to China. This offers high potential for expansion to rice millers in the country.

Rice milling machines offer one or two step procedure or a multiple step process. In a one-step rice milling process, bran and husk abstraction are performed in a single flow, and white rice is produced directly removed from paddy. In a two-step procedure, husk and bran are separately removed, and brown rice is derived. Rice Milling machines are used to produce an intermediate product. In multi-stage milling process, rice endures various procedure in each level of separation.

With the growing rice milling market in India, there is seen an increase in the demand of the rice milling machineries across the country. In last few years there has been an increase in the number of foreign players in the rice milling market in the country. The reason lies in the supportive policies and regulations, which promote new rice mills and the government offers various facilities to the new entrants in the market.

2.3 Market Potential

The India Rice Milling market is expected to reach market size of USD 392.6 Million by 2022. It is expected to grow at 3.51% CAGR during the forecast period 2022-2030.

A rice milling is food processing equipment where paddy is processed to rice. Paddy is collected from fields and is rechecked before the process begins. The rice product is procured from paddy fields, milled and hygienically processed in machinery with a dust free environment and cleaned using a sorting machines. This rice is further sold in the market to the end users. The basic objective of rice milling is to remove the husk and the bran layers to further produce edible, white rice.

This process of milling can be a one step, two-step process or a multi-stage process. In one step process husk and bran layers are removed in one pass, whereas in two-step process husk and bran layers are removed separately. Multi-stage milling process is mainly done in village or local consumption, where rice goes under different number of steps ranging from pre-cleaning to weighing of rice. This multi-stage milling process is used for marketing rice.

With the growing rice milling market in India, there is seen an increase in the demand of the rice milling machineries across the country. In last few years there has been an increase in the number of foreign players in the rice milling market in the country. The reason lies in the supportive policies and regulations, which promote new rice mills and the government offers various facilities to the new entrants in the market. This has offered flourishing market for the rice milling machinery manufacturers, both the national and international ones.

Furthermore the demographics of the country is such that rice is one of the most sort after food grain in the Indian agriculture. The monsoon and the terrain across the regions of North India, East India and South India support the rice cultivation of various grades and qualities. However there are few factors such as lack of proper storage and warehousing facilities along with crop failure restraint the market growth.

East India dominates the India rice milling market with 37.21% of share in 2016, in terms of value. It is expected to grow at a CAGR of 3.97% during the forecast period. The share is attributed to the increased government initiatives and planned investments in rice milling industries are driving the market. North India is expected to grow at a CAGR of 3.90% during the forecast period.

The increase in production of rice and the growing demand across the globe is the major factor influencing the growth of rice milling market. Moreover, the growth in agriculture, industrialization rate, increase of end-user application, and technology development has fueled the growth of rice milling market. The opportunity of handling paddy to rice through the rice milling machines has increased its demand in agriculture.

The rice mills services in India was reaches to USD \$72.8 million in the year of 2018 and is projected to register a CAGR of 4.7% during the forecast period from the year of 2020-2025.

The rice mills service market is composed to grow by USD \$119.84 million during the period from 2020-2023 progressing at a CAGR of 2% during the forecast period. At present, over 1, 30,000 rice mills services are available in India including modern rice mills.

Rice mills services is the oldest and the largest agro processing industry of the India. It has a turnover of more than Rs. 25,500 crore per annum. It processes about 85 million tones of paddy per year and provides staple food grain and other valuable products required by over 60% of the population.

2.4 Process

Paddy may contain up to 5 per cent of foreign matter such as lumps of soil, stones, stalk And chaff. Cleaning is done using vibratory screens and air. Two types of rice mills are in Used viz., the huller type and the automatic Sheller type. The huller mill is less costly than sheller mill but it gives less yield of rice. Sheller mills essentially consists of Cleaning sieves sheller, aspirator, paddy separator, cone polisher and sorting sieve, Modern rice mills have rubber roller Sheller's, which results in the least breakage of rice.

The clean paddy is conveyed to the sheller for dusking, using vertical bucket elevators. The husk is removed between the two rubber rollers or cast iron rollers coated with Cement of emery. Complete dushking does not take place here; about 5 to 20 percent Paddy remains unhusked.

Mixture is conveyed to the aspirator where the husk is sucked out using a suction fan. Rice grain is collected in a chamber and paddy is discharged at a third point and is sent Back to the sheller for further dusking.

Dusking rice is conveyed to cone polisher or whitener, consisting of an inverted truncated cone of cast iron coated with an abrasive emery cement mixtures. During the process a lasts of heat is generated resulting in breakage of grains. To prevent breakage the grains are usually passed through a series of pearling cones. The degree of polishing may be controlled to give partial or completely white rice. Now the Government of India has laid down the limit of 3-5 per cent removal of bran from unpolished or bran rice.

The polished rice is finally sieved to separate the bran from rice and to separate broken from head rice (full grains). The rice is then graded in various sizes for marketing. Apart from head rice (56%-65%) and broken rice (5-10%) the following are obtained during Milling of paddy, husk (15-25%) bran (5-10%) polish (1-4%) and other foreign matter. (1-3%).

During the paddy milling, rice is generally obtained about 60 to 70 percent; husk is obtained about 20 to 25 per cent, beside 5 per cent bran. The bran contains about 14 to 16 per cent oil, which can be obtained through solvent extraction process.

The basic rice milling processes consist of the following process.

Pre Cleaning: Removing all impurities and unfilled grains from paddy

De-stoning: Separating small stones from paddy

Parboiling (Optional): Helps in improving the nutritional quality by gelatinization of Starch inside the rice grain. It improves the milling recovery percent during deshelling And polishing / whitening operation

Husking: Removing husk from paddy

Husk Aspiration: Separating the husk from brown rice/ unhusked paddy

Paddy Separation: Separating the unhusked paddy from brown rice

Whitening: Removing all or part of the bran layer and germ from brown rice

Polishing: Improving the appearance of milled rice by removing the remaining bran particles and by polishing the exterior of the milled kernel

Length Grading: Separating small and large broken from head rice

Blending: Mixing head rice with predetermined amount of broken, as required by the customer

Weighing and bagging: Preparing the milled rice for transport to the customer

2.5 Current Scenario

- The global rice milling services market is expected to register a CAGR of 1.94% during the forecast period from the year of 2020-2025.
- The rice mills services market in India was USD \$172.8 million in the year of 2018 and is projected to register a CAGR of 2.7% during the forecast period.
- In the India the Revenue in the rice mill service segment is projected to reach USD \$258.09 million in the year of 2020.
- The average revenue per user in the rice mill service market segment is projected to amount to USD \$32.15 in the year of 2020.
- In the India most of revenue of the rice mill services will be generated from the local residency area with a projected market volume of USD \$84.63 million by the year of 2021.
- The Indian rice mill service market size was valued at USD \$231.9 billion in the year of 2018 and is expected to register a CAGR of 2.4% over the forecast period.
- The Indian rice mill service market was valued at USD \$136.2 billion in the year of 2017.
- The market size, measured by revenue, of the rice mill service industry in the India the CAGR is 3.8% in the year of 2019.
- The Indian market size of the rice mill service market is expectedly to increase 4.6% in the year of 2020 to 2021.
- The Indian market size of the rice mill services market has increase 6.2% per year on average between the years of 2018 to 2020.
- The India rice milling service market is expected to value an estimated USD \$392.6 million by the end of the year 2022 and witness a steady CAGR of 3.51% during the forecast period of the year 2016 - 2022.
- The India Rice Milling service market is expected to reach market size of USD 486.43 million by the year of 2024. It is expected to grow at 5.73% CAGR during the forecast period from the year of 2020 to 2024.

2.6 Challenges & Solutions

1. Under milled rice -

Under-milled rice is under-polished rice, or rice with bran streaks left in it. The bran contains much of the desired nutritious elements. Under milling will also yield higher milling recoveries. However, under-milled rice does not store well because of the high oil content of the bran. In addition, rice consumers almost universally desire well-milled rice because of its better appearance. Related to milling degree is the occurrence of red-streaked kernels, rice with part of the bran layer still sticking to the surface.

2. Broken grains -

Grain breakage is a result of fissuring, or the formation of cracks in the endosperm prior to milling. To a certain extent, fissuring in rice grain occurs naturally in the field due to daily changes in temperature and relative humidity. More importantly, fissuring can be caused by improper management of grain at all post-harvest operations from harvesting through to milling. Improper drying techniques often lead to fissuring in grain, or rewetting of stored paddy, and improper milling techniques. Finally, not all fissured grain will break during milling, and medium or long grain varieties are more prone to breakage than short grain varieties.

3. Discoloration -

Although whiteness is a varietal characteristic, the natural color of white rice can be affected by post-harvest discoloration. A general discoloration of the entire rice kernel occurs if wet paddy is left undried for extended periods. The wet grain will heat up, causing the grains to turn yellow or tan.

4. Chalkiness -

If part of the milled rice kernel is opaque rather than glowing, it is characterized as chalky. Chalkiness disappears upon cooking and has no effect on taste or aroma, however it downgrades milled rice. Chalky grains are more brittle than non-chalky grains and can break more easily during milling. Cause of chalkiness is interruption during the final stages of grain filling.

5. Damaged grains -

Damaged rice kernels are those which are fully or partially darkened as a result of insect, mold, water, or heat damage. The presence of even a few damaged grain kernels can severely downgrade rice.

6. Impurities -

Layers in milled rice are a sign of improperly cleaned paddy prior to milling, or contaminate the rice during milling.

2.7 SWOT Analysis

A SWOT analysis is an incredibly simple, yet powerful tool to help you develop your business strategy, whether you're building a start-up or guiding an existing company.

SWOT stands for Strengths, Weaknesses, Opportunities, and Threats.

SWOT Analysis is a strategic planning method used to evaluate strengths, weaknesses, opportunities, and threats, in a business project or a manufacturing business. These four factors are called SWOT (strengths, weaknesses, opportunities, and threats). This process involves the specific determination and objectives of a manufacturing or business project that identifies internal and external factors.

SWOT analysis can be applied by analyzing and observing the things that affect the four factors, then apply them in the picture in the SWOT matrix, apply the strengths map to take advantage of the opportunities, how to overcome the weaknesses that prevent the advantages of opportunities are able to deal with the threats that exist, and the last is how to overcome the weaknesses that can make threats become real or create a new threat. Determining the direction of development of a business is strongly influenced by many factors, namely internal and external factors.

One may think that they already know everything that they need to do, to succeed, but a SWOT analysis will force them to look at the business in new ways and from new directions.

Strengths

- Good product prototype and innovation
- Overall, manufacturing industry is relatively stable.
- Focus on value creation with leadership in product development leadership and high quality output
- Strong Research & Development Capabilities
- High level of Specialization

Weakness

- Employee skills need to be upgraded.
- Air pollution directly to the community.
- Lots of levies, unerring costs.
- Lack of finance

Opportunities

- Lot of scope for innovative products every now and then.
- Trends in increasing customer purchasing power.
- Opportunities in the manufacturing industry are in the technology and bio-technology areas. These are growing market segments with higher profit margins.

- New market opportunities and consolidation of the industry through Merger & Acquisition activities

Threats

- Regulation of government, regulations on tight industrial business
- Increasing freight transportation costs
- Competition from other manufacturing / process units
- Unnecessary changes in Government policies
- Geographical disadvantages

Notes to the Project Report

- a. Depreciation has been computed in accordance with the depreciation rates prescribed in the Income Tax Act. A separate depreciation schedule has been provided for reference and calculation purposes.
- b. The data presented, including sensitivity analysis and balance sheet synopsis, has been prepared utilizing standard financial assumptions and calculations.
- c. The financial projections and assessments are based on the assumption that there will be no changes in government policies and rules that may impact the loan applicant's business. Furthermore, it is assumed that no abnormal events will occur during the lifespan of the project or business.
- c. The financial projections and assessments are based on the assumption that there will be no changes in government policies and rules that may impact the loan applicant's business. Furthermore, it is assumed that no abnormal events will occur during the lifespan of the project or business.
- d. Provision for Income Tax has been made on the Rules and Regulations which are applicable for current scenario.
- e. The financial statements have been prepared under the standard assumption that the fiscal year-end occurs in March.
- f. The details of indirect expenses, break-even analysis, and security margin calculation have been provided in separate annexures for reference.
- g. The financial data pertaining to revenue from business operations, asset additions, existing obligations, etc., has been presented based on the information provided by the client.
- h. The projected data included in this report represents future-oriented financial information. It has been prepared based on the best judgment of the applicants, incorporating assumptions regarding the most probable set of economic conditions. However, it is important to note that this information should not be considered as a forecast.
- i. The information pertaining to the business entity, owner's profile, employment details, feasibility studies, industry analysis, market potential, current scenario, and challenges-solutions has been compiled based on discussions and inputs provided by the loan applicant.
